Substitution Rule

Integration by parts

Integrals of rational functions

Trigonometric integrals

Rationalizing substitutions

Examples of Euler substitutions

- Given the velocity of a function, one wishes to know its position at a given time.
- Find a function whose derivative is known.

Antiderivatives

Examples of Euler substitutions

Definition

A function $F(x)$ is called an **antiderivative of $f(x)$ on an interval I** if $F'(x) = f(x)$ for all $x \in I$.

Example

- $(\ln(1 + x^2))' = \frac{2x}{1+x^2}$ so $\ln(1 + x^2)$ is an antiderivative of $\frac{2x}{1+x^2}$.
- $x^4 + 2$ is an antiderivative of $4x^3$.

Theorem

If $F(x)$ is an antiderivative of $f(x)$ on I . Then the family of all antiderivatives of $f(x)$ is $F(x) + C$.

Definition

The family of all antiderivatives is called **the indefinite integral** of $f(x)$.

Denote $\int f(x)dx = F(x) + C$, where $F(x)$ is a known antiderivative.

$$\int \frac{2x}{1+x^2} dx = \ln(1+x^2) + C, \quad \int 4x^3 dx = x^4 + C.$$

Linearity

Let $F(x)$, $G(x)$ be antiderivatives of $f(x)$, $g(x)$ respectively.
Then

$$\int (Af(x) + Bg(x))dx = AF(x) + BG(x) + C.$$

Theorem

A function $f(x)$ which is continuous on $[a, b]$ has an antiderivative on that interval.

Rationalizing substitutions

Examples of Euler substitutions

$$\int x^{\alpha} dx = \begin{cases} \frac{x^{\alpha+1}}{\alpha+1} + C & \text{if } \alpha \neq -1, \\ \ln |x| + C & \text{if } \alpha = -1. \end{cases}$$

$$\int a^x dx = \frac{a^x}{\ln a} + C, 0 < a \neq 1$$

$$\int \sin x dx = -\cos x + C, \quad \int \cos x dx = \sin x + C$$

$$\int \frac{dx}{\sin^2 x} = -\cot x + C, \quad \int \frac{dx}{\cos^2 x} = \tan x + C$$

$$\int \frac{dx}{a^2 + x^2} = \frac{1}{a} \arctan \frac{x}{a} + C$$

$$\int \frac{dx}{\sqrt{a^2 - x^2}} = \arcsin \frac{x}{a} + C.$$

The Substitution Rule

Theorem

If $u = g(x)$ is a differentiable function whose range is an interval I and f is continuous on I , then

$$\int f(g(x))g'(x)dx = \int f(u)du.$$

Example

Evaluate the following integrals

$$1 \quad \int \frac{x^4 dx}{x^{10} + 1}$$

$$2 \quad \int \frac{dx}{e^x - e^{-x}}$$

$$3 \quad \int \frac{dx}{\sqrt{x^2 + 4}}$$

- Rationalizing substitutions

Integration by parts

Assume that $u(x)$, $v(x)$ are continuously differentiable functions. We have

$$\int u dv = uv - \int v du.$$

Example

Evaluate the integrals

$$1 \quad \int \frac{x}{\cos^2 x} dx$$

$$2 \quad \int e^x \cos 2x dx$$

$$3 \quad \int \sqrt{x^2 + \alpha} dx$$

Aim: Evaluate $\int R(x)dx$, where

$$R(x) = \frac{b_0 + b_1x + \dots + b_mx^m}{a_0 + a_1x + \dots + a_nx^n}, a_i, b_i \in \mathbb{R}, a_n, b_m \neq 0,$$

is a rational function.

Method: expressing $R(x)$ as a sum of partial fractions.

- 1 Performing a polynomial division to reduce to proper rational function.
- 2 Factorizing the denominator into factors $(x - a)^k, (x^2 + px + q)^k$, where $q - \frac{p^2}{4} > 0$.
- 3 Writing $R(x)$ as the sum of following functions

$$\int \frac{A_l dx}{(x - a)^l}, \quad \int \frac{B_l x + C_l}{(x^2 + px + q)^l} dx, l = 1, 2, \dots, k.$$

Trigonometric integrals $\int \mathcal{R}(\sin x, \cos x) dx$

Indefinite integrals

Definition
Properties

Table of indefinite integrals

Substitution Rule

Integration by parts

Integrals of rational functions

Trigonometric integrals

Rationalizing substitutions

Examples of Euler substitutions

Evaluate $\int \mathcal{R}(\sin x, \cos x) dx$, where $\mathcal{R}(\sin x, \cos x)$ is a rational function of the variables $u = \sin x$, $v = \cos x$.

General substitution $t = \tan \frac{x}{2}$, $t \in (-\pi, \pi)$. We obtain

$$\int \mathcal{R}\left(\frac{2t}{1+t^2}, \frac{1-t^2}{1+t^2}\right) \frac{2dt}{1+t^2}.$$

Example

Evaluate $\int \frac{dx}{2 \sin x - \cos x + 5}.$

Special cases

Indefinite integrals

Definition
Properties

Table of indefinite integrals

Substitution Rule

Integration by parts

Integrals of rational functions

Trigonometric integrals

Rationalizing substitutions

Examples of Euler substitutions

- If $\mathcal{R}(-\sin x, -\cos x) = \mathcal{R}(\sin x, \cos x)$, set $t = \tan x$ or $t = \cot x$. Examples: $\int \frac{dx}{\sin^2 x \cos^4 x}$, $\int \frac{\tan x dx}{1 + \cos^2 x}$.
- If $\mathcal{R}(-\sin x, \cos x) = -\mathcal{R}(\sin x, \cos x)$, set $t = \cos x$.
Examples $\int \frac{dx}{(2 + \cos x) \sin x}$
- If $\mathcal{R}(\sin x, -\cos x) = -\mathcal{R}(\sin x, \cos x)$, set $t = \sin x$.

If we can write

$$a_1 \cos x + b_1 \sin x = A(a \sin x + b \cos x) + B(a \cos x - b \sin x).$$

Then

$$\begin{aligned} \int \frac{a_1 \cos x + b_1 \sin x}{a \sin x + b \cos x} dx &= \int \left(A + B \frac{a \cos x - b \sin x}{a \sin x + b \cos x} \right) dx \\ &= Ax + B \ln |a \sin x + b \cos x| + C. \end{aligned}$$

Example

$$\int \frac{\sin x - \cos x}{\sin x + 2 \cos x} dx, \quad \int \frac{\sin x}{\sin x - 3 \cos x} dx$$

Examples of Euler
substitutions

■ $\int \mathcal{R}(x, \sqrt{a^2 - x^2}) dx.$

Set $x = a \sin t$, $t \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$, or $x = a \cos t$, $t \in [0, \pi]$.

■ $\int \mathcal{R}(x, \sqrt{x^2 - a^2}) dx.$

Set $x = \frac{a}{\sin t}$, $t \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$, $t \neq 0$, or $x = \frac{a}{\cos t}$,
 $t \in (0, \pi)$, $t \neq \frac{\pi}{2}$.

■ $\int \mathcal{R}(x, \sqrt{a^2 + x^2}) dx.$

Set $x = a \tan t$, $t \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$, or $x = a \cot t$, $t \in (0, \pi)$.

Example

Evaluate

$$1 \quad \int \frac{x^3 dx}{\sqrt{1-x^2}}$$

$$2 \quad \int \frac{dx}{x\sqrt{x^2+2x+2}}$$

$$3 \quad \int x\sqrt{-x^2+4x-3} dx$$

$$\int \mathcal{R}(x, \sqrt{Ax^2 + Bx + C}) dx, A > 0$$

Rule: $A > 0$, set $\sqrt{Ax^2 + Bx + C} = t \pm \sqrt{Ax}$.

Example

Evaluate $I = \int \frac{dx}{x + \sqrt{x^2 + x + 1}}$

Set $\sqrt{x^2 + x + 1} = t - x$. Then $x = \frac{t^2 - 1}{2t + 1}$, $dx = \frac{2(t^2 + t + 1)}{(2t + 1)^2} dt$.

$$\begin{aligned} I &= \int \frac{2(t^2 + t + 1)}{t(2t + 1)^2} dt = \int \left(\frac{2}{t} - \frac{3}{2t + 1} - \frac{3}{(2t + 1)^2} \right) dt \\ &= 2 \ln |t| - \frac{3}{2} \ln |2t + 1| + \frac{3}{2(2t + 1)} + C \\ &= 2 \ln |\sqrt{x^2 + x + 1} + x| - \frac{3}{2} \ln |2(\sqrt{x^2 + x + 1} + x) + 1| + \\ &\quad + \frac{3}{4(\sqrt{x^2 + x + 1} + x) + 2} + C \end{aligned}$$

$$\int \mathcal{R}(x, \sqrt{Ax^2 + Bx + C}) dx, \quad C > 0$$

Rule: $C > 0$, set $\sqrt{Ax^2 + Bx + C} = xt \pm \sqrt{C}$.

Example

Evaluate $I = \int \frac{dx}{1 + \sqrt{1 - 2x - x^2}}$

Set $\sqrt{1 - 2x - x^2} = tx - 1 \Rightarrow x = \frac{2(t-1)}{t^2+1}, \quad dx = \frac{2(3t^2-2t+1)}{(t^2+1)^2} dt.$

$$\begin{aligned} I &= \int \frac{3t^2 - 2t + 1}{t(t-1)^2(t^2+1)} dt = \int \left(-\frac{1}{t} + \frac{1}{t-1} + \frac{2}{t^2+1} \right) dt \\ &= -\ln|t| + \ln|t-1| + 2 \arctan t + C \\ &= -\ln \left| \frac{\sqrt{1-2x-x^2} + 1}{x} \right| + \ln \left| \frac{\sqrt{1-2x-x^2} + 1}{x} - 1 \right| + \\ &\quad + 2 \arctan \frac{\sqrt{1-2x-x^2} + 1}{x} + C \end{aligned}$$

$$\int \mathcal{R}(x, \sqrt{A(x - \alpha)(x - \beta)}) dx$$

Fact: there are functions that $\int f(x)dx$ is not an elementary function. We cannot evaluate their integrals in terms of the functions we know, for instance

$$\int e^{x^2} dx, \int \frac{\sin x}{x} dx, \int \frac{1}{\ln x} dx \dots$$
